

Scenario:

You are an uber driver working the night shift. You are worried about your safety so you download the VoiceMemo defense app. You start using the app to make sure you are able to document any crime that is around you.

Task 1: Find a recording that was a couple of months ago and send it to someone.

Task 2: Alter the settings in the app so it best suits your safety needs. For example change the decibel meter.

Task 3: The app recorded an audio file that might be useful to you in the future, find it and send it to someone.

Notes:

What changes would I make to the app:

- 1) Be able to change the name of the recording and be able to search for recordings
- 2) Have some presets for the settings just in case it is too technical for people. Also allow for key words to be entered into the app so it knows to respond to certain words.
- 3) Be able to “favorite” a recording

What do I need to keep the same in the app:

- 1) Keep the recording tab the way it is now, but just add some features.
- 2) Keep the settings tab simple and easy to understand.
- 3) Keep the decibel meter as a changeable value, so people can change them if they need to.
